

**BSGIE Annual Meeting 2016**

**GASTRO-INTESTINAL EMERGENCIES IN ENDOSCOPY**  
**SHOULD I STAY OR SHOULD I GO ?**  
for Endoscopists and Endoscopy Nurses  
THURSDAY 22 SEPTEMBER 2016 - KINEPOLIS IMAGIBRAINE

Non-variceal upper gastro-intestinal bleeding

D. De Looze, MD, PhD  
University Hospital Gent, Belgium

Variceal and non-variceal upper GI bleeding still is a lethal disease

Mortality rates for upper GI bleeding in Europe

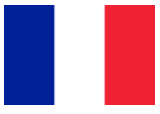

**N=6750**

**New patients 7%**  
**Inpatients 26%**

**Mean 10%** (UK 1993 14%)

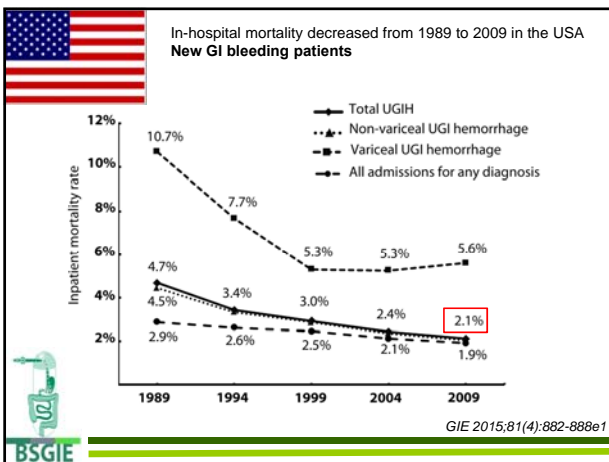

Gut 2011;60:1327-1335  
Data from 2007

**N=3203**

**New patients 8,3%**

Endoscopy 2012;44:998-1008  
Data from 2005-2006

In-hospital mortality decreased from 1989 to 2009 in the USA  
New GI bleeding patients

	1989	2009
<b>In hospital endoscopy</b>	70%	85%
<b>Endotherapy</b>		
<b>Nonvariceal</b>	10%	22%
<b>Variceal</b>	3%	66%
<b>Endoscopy &lt; 24 h</b>	36%	70%

GIE 2015;81(4):882-888e1

55-year old woman - saturday 11.30 PM  
Presents at the emergency department with  
hematemesis  
No other medical conditions – no risk factors for liver  
disease  
Medication: aspirin (Asaflo 80 mg daily) since 6  
months (primary prevention – read it in a magazine)

Blood pressure 94/60 mm Hg  
Heart rate 108 beats/minute

Lab results: hemoglobin 11,0 g/dl  
platelets 220.000/ul – INR 1.0  
blood urea nitrogen 40 mg/dl

BLOOD UREA (mg/dL)	SCORE VALUE
39-48	2
49-60	3
61-150	4
> 150	6
<b>HEMOGLOBIN FOR MEN (g/dL)</b>	
12-12.9	1
10-11.9	3
< 10	6
<b>HEMOGLOBIN FOR WOMEN (g/dL)</b>	
10-11.9	1
< 10	6
<b>SYSTOLIC BLOOD PRESSURE (mmHg)</b>	
100-109	1
90-99	2
< 90	3
<b>OTHER MARKERS</b>	
Pulse ≥ 100/min	1
Melena	1
Syncope	2
Hepatic disease	2
Cardiac failure	2
<b>TOTAL score</b>	<b>5</b>

**GASTRO-INTESTINAL EMERGENCIES IN ENDOSCOPY**  
**SHOULD I STAY OR SHOULD I GO ?**  
for Endoscopists and Endoscopy Nurses

Intravenous fluid, PPI and....

1. Upper GI endoscopy at the emergency room (0.00 am)
2. Transfer to ICU, upper GI endoscopy within 3 hours (2.00 am)
3. Gastro ward and upper GI endoscopy first thing in the morning (8.00 am)
4. Gastro ward and elective endoscopy on monday morning

**Suspicion of non-variceal gastro-intestinal bleeding**

Upper GI bleeding management. Belgian guidelines for adults and children. Acta Gastroenterologica Belgica 2011; 74:45-66

**STEP 1**

**RESUSCITATION**  
Aim: MAP > 65 mmHg and/or systolic BP > 100 mm Hg

**Volume-expander** Cristalloids  
**Vasopressor** (if persisting hypotension) Noradrenalin

**Blood transfusion** Aim: hemoglobin 8 g/dl (9-10g/dl if cardiovascular disease)

**Intubation/sedation** (if hematemesis, hemodynamic instability, altered mental status)

**Transfer ICU** Glasgow Blatchford score > 8 or Glasgow coma scale < 8

**Suspicion of non-variceal gastro-intestinal bleeding**

Upper GI bleeding management. Belgian guidelines for adults and children. Acta Gastroenterologica Belgica 2011; 74:45-66

**STEP 2**

**Erythromycin 250 mg IV/5 min.**      **PPI 40 mg IV**  
20 minutes before endoscopy      20 min. before endoscopy

Significant impact on - empty stomach  
- need for second endoscopy  
- blood transfusion  
- length of hospital stay

Lesser - stigmata of recent bleeding  
- need for endotherapy

No significant impact - endoscopic procedure time  
- mortality

No significant impact - mortality  
- rebleeding  
- need for surgery

Meta-analysis in Alim Pharm Ther 2011;34:166-171      Cochrane review 2010; Jul 7

**Erythromycin before endoscopy for acute upper gastrointestinal bleeding**

**EMPTY STOMACH**

Study or subgroup	Erythromycin		Placebo		Weight	Risk ratio		Risk ratio	
	Events	Total	Events	Total		M-H, Fixed, 95% CI	M-H, Fixed, 95% CI		
Altrairl 2011	23	47	10	43	17.2%	2.10	[1.14, 3.90]		
Carbonell 2008	32	49	22	50	35.8%	1.48	[1.02, 2.16]		
Coffin 2002	17	19	12	22	18.3%	1.64	[1.09, 2.46]		
Frossard 2002	42	51	18	54	28.7%	2.47	[1.66, 3.68]		
Total (95% CI)	166		169		100.0%	1.90	[1.53, 2.37]		
Total events	114		62						

Heterogeneity:  $\tau^2 = 3.96$ ,  $df = 3$  ( $P = 0.27$ );  $I^2 = 24\%$   
Test for overall effect:  $Z = 5.74$  ( $P < 0.00001$ )

250 mg erythromycin in 50 cc NaCl 0,9% IV over 5 minutes - endoscopy is performed 20 minutes after the end of the infusion  
(other studies: 125 mg/50ml/10min - 250 mg/100ml/30min - 3mg/kg in 125 ml/30 min)

Meta-analysis in Alim Pharm Ther 2011;34:166-171

**Erythromycin before endoscopy for acute upper gastrointestinal bleeding**

Table 3. Meta-analysis of effects of erythromycin on secondary outcomes

	RR or mean difference (CI)	Z	P value	Heterogeneity		
				$\chi^2$	P	$I^2$
Second endoscopy	0.56 (0.36, 0.88)	2.50	0.01	4.46	0.22	33%
Blood transfusion	-0.51 (-0.95, -0.07)	2.27	0.02	0.28	0.96	0%
Hospital stay	-0.99 (-1.54, -0.41)	3.39	0.0007	3.24	0.36	7%
Procedure time	-1.73 (-4.46, 1.00)	1.24	0.21	10.44	0.02	71%
Death	0.51 (0.17, 1.52)	1.21	0.23	0.36	0.55	0%

Significant impact on - need for second endoscopy  
- blood transfusion  
- length of hospital stay

No significant impact (NS) on - endoscopic procedure time  
- mortality

Meta-analysis in Alim Pharm Ther 2011;34:166-171

**PPI before endoscopy for acute upper gastrointestinal bleeding**

Cochrane review 2010; Jul 7

Six RCTs comprising 2223 participants

	PPI before endoscopy	PPI after endoscopy	OR (95%CI)
Mortality	6,1%	5,5%	1,12 (0,72-1,73)
Rebleeding	13,9%	16,6%	0,81 (0,61-1,09)
Surgery	9,9%	10,2%	0,96 (0,68-1,35)
Stigmata recent hemorrhage*	37,2%	46,5%	0,67 (0,54-0,84)
Need for endotherapy	8,6%	11,7%	0,68 (0,50-0,93)

\*Stigmata: active bleeding, non bleeding visible vessel, adherent clot

**Timing of endoscopy in suspected non-variceal upper GI bleeding**  
Belgian guidelines for adults and children.  
*Acta Gastroenterologica Belgica 2011; 74:45-66*

**STEP 3**

**Endoscopy**  
< 24h after admission  
Quicker if Glasgow Coma Scale < 8

**Timing of endoscopy in upper GIB and EBM?**

LOW RISK			
<i>Lee et al GIE 1999;50:755-761</i>	110 patients HD stable	<2h vs. < 48h	Early endoscopy: early discharge / cheaper
<i>Bjorkman et al GIE 2004;60:1-8</i>	93 patients HD stable	<6h vs. < 48h	Early endoscopy may lead to early discharge (but is not always done)
HIGH RISK			
<i>Lin et al (RCT) J Clin Gastro 1996;22:267</i>	All pts. Red blood in NG tube	<12h vs. > 12h	No advantage Less transfusion / shorter hospital stay
<i>Lim et al (OBS) Endoscopy 2011;43:300</i>	934 pts NVGIB GBS >12	< 13h vs. > 13h	0 % vs. 44% mortality (p<0.001) Multivariate analysis: time from presentation to endoscopy
<i>Targownik (retro) Can J Gastro 2007;21:425</i>	166 pts GBS>3 (HR>100 and BP<100)	< 6h vs. 6-24h <i>rapid vs early</i>	No difference in rebleeding, surgery need, mortality

**Timing of endoscopy in suspected non-variceal upper GI bleeding**  
*American College of Gastroenterology (2012)*

**Recommendations.**  
9. Patients with UGIB should generally undergo endoscopy **within 24 h of admission**, following resuscitative efforts to optimize hemodynamic parameters and other medical problems (Conditional recommendation, low-quality evidence).  
10. In patients who are hemodynamically stable and without serious comorbidities endoscopy should be performed as soon as possible in a non-emergent setting to identify the substantial proportion of patients with low-risk endoscopic findings who can be safely discharged (Conditional recommendation, moderate-quality evidence).  
11. In patients with **higher risk clinical features (e.g., tachycardia, hypotension, bloody emesis or NG aspirate in hospital) endoscopy within 12 h may be considered** to potentially improve clinical outcomes (Conditional recommendation, low-quality evidence).

*Am J Gastro 2012;107:345-360*

**Timing of endoscopy in suspected non-variceal upper GI bleeding**

**Diagnosis and management of nonvariceal upper gastrointestinal hemorrhage: European Society of Gastrointestinal Endoscopy (ESGE) Guideline**  
*Gastrointest Endosc 2015; 81: a1-a46*

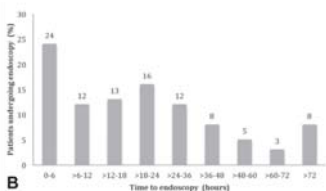

MR7. Following hemodynamic resuscitation, ESGE recommends **early (≤24 hours) upper GI endoscopy**.

**Very early (<12 hours) upper GI endoscopy may be considered in patients with high risk clinical features**, namely: hemodynamic instability (**tachycardia, hypotension**) that persists despite ongoing attempts at volume resuscitation; in-hospital bloody emesis/nasogastric aspirate, or contraindication to the interruption of anticoagulation (strong recommendation, moderate quality evidence).

*Endoscopy 2015; 47(10): a1-a46*

**Timing of endoscopy**  
Daily practice (Canadian audit)

Median time to endoscopy was  
17.7 h (IQR 6.1 h to 29.4 h).  
Suspected variceal bleeding  
12.4 h (IQR 4.5 h to 25.0 h)  
Nonvariceal bleeding  
18.3 h (IQR 6.3 h to 30.0 h)  
(Variceal vs. nonvariceal: P=0.0038).  
Overall, 65.6% of patients underwent endoscopy within 24 h.

*Can J Gastroenterol Hepatol 2014;28 (9):495-501*

**Risks of "rapid" endoscopy**

- Oxygen desaturation / inappropriate resuscitation  
HD unstable patient
- Airway protection
- Not enough visualisation
- Need for a trained endoscopy nurse/assistant

**GASTRO-INTESTINAL EMERGENCIES IN ENDOSCOPY**  
**SHOULD I STAY OR SHOULD I GO ?**  
for Endoscopists and Endoscopy Nurses

**Blood pressure is normalized by fluid etc...and**

1. Upper GI endoscopy at the emergency room (0.00 am)
2. Transfer to ICU, upper GI endoscopy within 3 hours (2.00 am)
3. Gastro ward and upper GI endoscopy first thing in the morning (8.00 am)
4. Gastro ward and elective endoscopy on monday morning

Guidelines: endoscopy within 12 h (US) or 24 h (EUR) / no need for ICU

Suspected non-variceal upper GI bleeding

**SHOULD I STAY OR SHOULD I GO ?**  
for Endoscopists and Endoscopy Nurses  
THURSDAY 22 SEPTEMBER 2016 - KINEPOLIS IMAGIBRAINE

Always within 24 hours after admission

Low risk	High risk
Early endoscopy leads to early discharge	Within 12 hours
	Use your common sense!
